

Danfoss

## 

Rotating shafts and electrical equipment can be hazardous. Therefore, it is strongly recommended that all electrical work conform to the National Electrical Code (NEC) and all local regulations. Installation, start-up and maintenance should be performed only by qualified personnel.

Factory recommended procedures, included in this manual, should be followed. Always disconnect electrical power before working on the unit.

Although shaft couplings or belt drives are generally not furnished by the manufacturer, rotating shafts, couplings and belts must be protected with securely mounted metal guards that are of sufficient thickness to provide protection against flying particles such as keys, bolts and coupling parts. Even when the motor is stopped, it should be considered "alive" as long as its controller is energized. Automatic circuits may start the motor at any time. Keep hands away from the output shaft until the motor has completely stopped and power is disconnected from the controller.

Motor control equipment and electronic controls are connected to hazardous line voltages. When servicing drives and electronic controls, there will be exposed components at or above line potential. Extreme care should be taken to protect against shock. Stand on an insulating pad and make it a habit to use only one hand when checking components. Always work with another person in case of an emergency. Disconnect power whenever possible to check controls or to perform maintenance. Be sure equipment is properly grounded. Wear safety glasses whenever working on electric control or rotating equipment.

## Safety Guidelines

- 1. The drive must be disconnected from the AC line before any service work is done.
- 2. The "Stop/Off" key on the local control panel of the drive

does not disconnect the equipment from the AC line and is not to be used as a safety switch.

- 3. Correct protective grounding of the equipment must be established. The user must be protected against supply voltage and the motor must be protected against overload in accordance with applicable national and local regulations.
- 4. Ground currents are higher than 3 mA.

# Warnings Against Unintended Start

- While the drive is connected to the AC line, the motor can be brought to a stop by means of external switch closures, serial bus commands or references. If personal safety considerations make it necessary to ensure that no unintended start occurs, these stops are not sufficient.
- 2. During programming of parameters, the motor may start. Be certain that no one is in the area of the motor or driven equipment when changing parameters.
- 3. A motor that has been stopped may start unexpectedly if faults occur in the electronics of the drive, or if an overload, a fault in the supply AC line or a fault in the motor connection or other fault clears.
- 4. If the "Local/Hand" key is activated, the motor can only be brought to a stop by means of the "Stop/Off" key or an external safety interlock.

### NOTE:

It is responsibility of user or person installing drive to provide proper grounding and branch circuit protection for incoming power and motor overload according to National Electrical Code (NEC) and local codes.

The Electronic Thermal Relay (ETR) is UL listed. VLTs provide Class 20 motor overload protection in accordance with the NEC in single motor applications, when VLT 6000/8000 parameter 117 (VLT 5000 parameter 128) is set for ETR Trip 1 and parameter 105 is set for rated motor (nameplate) current.

# 

Touching electrical parts may be fatal – even after equipment has been disconnected from AC line. To be sure that capacitors have fully discharged, wait 14 minutes after power has been removed before touching any internal component.

## LonWorks Overview

LonWorks is both an existing standard and hardware developed by Echelon Corporation. Echelon's stated goal is to establish a commodity solution to the presently daunting problems of designing and building control networks.

The result is LonMark Interoperability which makes it possible for independent network devices to operate together over a LonWorks network. The LonMark program was developed to address interoperability issues. As a result, the LonMark Interoperability Association Task Groups (LonUsers Groups) were developed. The task groups determine that each device on the network has an object definition, create standards and models to be used by particular applications and create a common platform for presenting data. A standard network variable type (SNVT) facilitates interoperability by providing a well defined interface for communication between devices made by different manufacturers. The VLT Frequency Converter supports the node object and controller standard object definitions of LonMark Interoperability.

Customers are currently using LonWorks for process control, building automation, motor control, elevator operation, life safety systems, power and HVAC distribution and similar intelligent building applications.

## LON Concept

The LonWorks communications structure is similar to that of a local area network (LAN) in that messages are continually exchanged between a number of processors. A LonWorks system is a determined local operating network (LON). LON technology offers a means for integrating various distributed systems that perform sensing, monitoring, control, and other automated functions. A LON allows these intelligent devices to communicate with one another through an assortment of communications media using a standard protocol.

LON technology supports distributed, peerto-peer communications. That is, individual network devices can communicate directly with one another without need for a central control system. A LON is designed to move sense and control messages which are typically very short and which contain commands and status information that trigger actions. LON performance is viewed in terms of transactions completed per second and response time. Control systems do not need vast amounts of data, but they do demand that the messages they send and receive are absolutely correct. The critical factor in LON technology is the assurance of correct signal transmission and verification.

Applications

An important LonWorks benefit is the network's ability to communicate across different types of transmission media. The NEURON chip is the heart of the LonWorks system. The NEURON chip's communication port allows for the use of transceivers for other media (such as coax and fiber optic) to meet special needs.

LonWorks control devices are called nodes. Physically, each node consists of a NEURON chip and a transceiver. With proper design, the nodes become building blocks that can be applied to control a variety of tasks, such as lighting or ventilating, integrating a variety of communications media.

The tasks which the nodes perform are determined by how they have been connected and configured. Because hardware design, software design, and network design may be independent in a LonWorks-based system, a node's function can be programmed to accommodate the networks in which it will be used.

Danfoss

VLT LonWorks Option Card	The Danfoss VLT LonWorks option card is comprised of a control card with a NEURON chip and a memory card. When installed into the VLT frequency converter, the unit enables the drive to communicate with other devices on the LON. The VLT drive is designed to provide precision control of standard induction electrical motors. The drive receives three reference signals along with start/stop and reset commands from the network. The drive also receives a 16-bit control word that provides full operational control of the drive. (See <i>Network Drive Control Input</i> for additional details.)	LonWorks supports many different types of transmission media. A LonWorks network physical layer option can be transformer coupled twisted pair (78 kbps and 1.25 Mbps), free topology, link power, power line, RF, RS-485, fiber optic, coaxial, or infrared. The VLT LonWorks option supports four transmission media with three versions of the VLT LonWorks option card. The VLT LonWorks option card versions are: 1. Free topology, which also operates on a link power network.
	In response, the drive provides 16 output network variables containing important drive and motor data. (See <i>Drive Feedback to</i> <i>Network</i> .) Output to the network includes drive status, current, voltage, motor and inverter thermal status, and alarms and warnings.	<ul> <li>2. 78 kbps transformer coupled twisted pair.</li> <li>3. 1.25 Mbps transformer coupled twisted pair.</li> <li>A router is required to interface to a LonWorks patroner is uppended by one of the pair.</li> </ul>
		network when not supported by one of the three option card versions.
Node Arrangements	LonWorks nodes can be addressed either individually or in groups. A group can contain up to 64 nodes, and one LonWorks network can support 255 groups. Furthermore, any node can be part of 15 different groups. A subnet, very similar to a group, can contain 127 nodes. A domain is the largest arrangement of nodes with a single domain able to handle 255 subnets. Thus a domain can handle 32,385 separate nodes. A single node may be connected to no more than two domains. The group structure has the advantage of allowing a number of nodes to be reached at only one address. This method reduces the	record keeping inside each chip to a minimum, allowing faster operation. However, high efficiency individual addressing can be done at all levels of a LonWorks system. The address table of a node contains entries for the group type and size and tells the node how many acknowledgments to expect when it sends a message. It also tells the NEURON chip which domain to use and the node group member number, which identifies an acknowledgment as coming from the node. The address also contains a transmit timer, a repeat timer, a retry counter, a receive timer, and the group ID.
Message Passing	There are a number of trade-offs between network efficiency, response time, security, and reliability. Generally, LonWorks defaults to the greatest degree of safety and verification for all communications over the LON network. The LonTalk protocol, built into the chips, is the operating system that coordinates the LonWorks system. It offers four basic types of message service.	The most reliable service is <i>acknowledged</i> (or end-to-end acknowledged service), where a message is sent to a node or group of nodes and individual acknowledgments are ex- pected from each receiver. If an acknowledgment is not received from all des- tinations, the sender times out and re-tries the transaction. The number of retries and time-out duration are both selectable. Ac-

Danfoss

## Message Passing (continued)

knowledgments are generated by the network host processor without intervention of the application. Transaction IDs are used to keep track of messages and acknowledgments so that the application does not receive duplicate messages.

An equally reliable service is *request/response*, where a message is sent to a node or group of nodes and individual responses are expected from each receiver. Incoming messages are processed by the application on the receiving side before a response is generated. The same retry and time-out options are available as with *acknowledged* service. Responses may include data, so that this service is particularly suitable for remote procedure call or client/server applications. Next in reliability is *unacknowledged repeated*. Messages are sent multiple times to a node or a group of nodes with no response expected. This service is typically used when broadcasting to large groups of nodes when traffic generated by all the responses would overload the network.

The final method in reliability is *unac-knowledged*, where a message is sent once to a node or group of nodes and no response is expected. This option is typically used when the highest performance is required, network bandwidth is limited, and the application is not sensitive to the loss of a message.

## Collision Detection

The LonTalk protocol uses a unique collision avoidance algorithm which allows an overloaded channel to carry near to its maximum capacity, rather than reducing its throughput due to excessive collisions between messages. When using a communications medium that supports collision detection, such as twisted pair, the LonTalk protocol can optionally cancel transmission of a packet as soon as a collision is detected by the transceiver. This option allows the node to immediately retransmit any packet that has been damaged by a collision. Without collision detection, the node would wait the duration of the retry time to notice that no acknowledgment was received. At that time it would retransmit the packet, assuming acknowledge or request/response service. For unacknowledged service, an undetected collision means that the packet is not received and no retry is attempted.

## Network Management

Depending on the level of a given application, a LonWorks network may or may not require the use of a network management node. A network management node performs management functions, such as:

- Find unconfigured nodes and download their network addresses.
- Stop, start, and reset node applications.
- Access node communication statistics.
- Configure routers and bridges.
- Download new applications programs.
- Extract the topology of a running network.

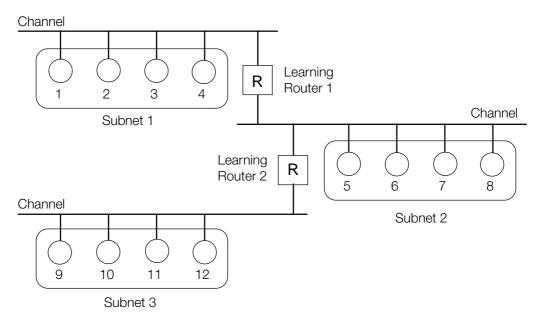

Danfoss

### Routers and Bridges

A router (or bridge) is a special node that consists of two connected NEURON chips, each connected to a separate channel (see figure below). Routers and bridges pass packets back and forth between these channels. There are four types of routers. A repeater is the simplest form of router, simply forwarding all packets between the two channels. A bridge simply forwards all packets which match its domains between the two channels. Using a bridge or repeater, a subnet can exist across multiple channels. A *learning router* monitors the network traffic and learns the network topology at the domain/subnet level. The learning router then uses its knowledge to selectively route packets between channels. Like a learning router, a configured router selectively routes packets between channels by consulting internal routing tables. Unlike a learning router, the contents of the internal routing tables are specified using network management commands.

Initially, each router sets its internal routing tables to indicate that all subnets could lie on either side of the router. Suppose that node 6, in the figure below, generates a message bound for node 2. Learning router 1 initially picks up the message. It examines the source subnet field of the message and notes in its internal routing tables that subnet 2 lies below it. The router then compares the source and destination subnet IDs and, since they are different, the message is passed on. Meanwhile, learning router 2 also passes the message on, making an appropriate notation in its internal routing tables regarding the location of subnet 2.

Suppose now that node 2 generates an acknowledgment. This acknowledgment is picked up by learning router 1, which now notes the location of subnet 1. Learning router 1 examines its internal routing tables, and, noting that subnet 2 lies below, passes the message on. When the message appears on subnet 2, it is noted by both node 6 (the destination) and learning router 2. Learning router 2 does not pass it on but merely notes that subnet 1, like subnet 2, lies somewhere above. Learning router 2 will not learn of the existence or location of subnet 3 until a message is originated from there. Subnets cannot cross routers. While bridges and repeaters allow subnets to span multiple channels, the two sides of a router must belong to separate subnets. Since routers are selective about the packets they forward to each channel, the total capacity of a system can be increased in terms of nodes and connections.

Danfoss

### Wiring Installation

Wiring The frequency converter generates a carrier frequency with a pulse frequency between 3 kHz and 14 kHz. This results in radiated frequency noise from the motor cables. It is very important that the LonWorks cable be isolated as much as possible from the drive output cabling to the motor. Use shielded wire rather than twisted-pair. Do not run LonWorks cabling and motor cables in parallel or in close proximity to one another. Ensure that the drive is properly grounded.

## Card Installation

The following section describes the installation procedures for the LonWorks option card (see following illustration). For additional information on installation and operation of the VLT frequency converter, refer to the *VLT Instruction Manual*.

## 

VLT frequency converter contains dangerous voltages when connected to line power. After disconnecting from line, wait at least 14 minutes before touching any electrical com-ponents.

## 

Only a competent electrician should carry out electrical installation. Improper installation of motor or VLT can cause equipment failure, serious injury or death. Follow this manual, National Electrical Code (USA) and local safety codes.

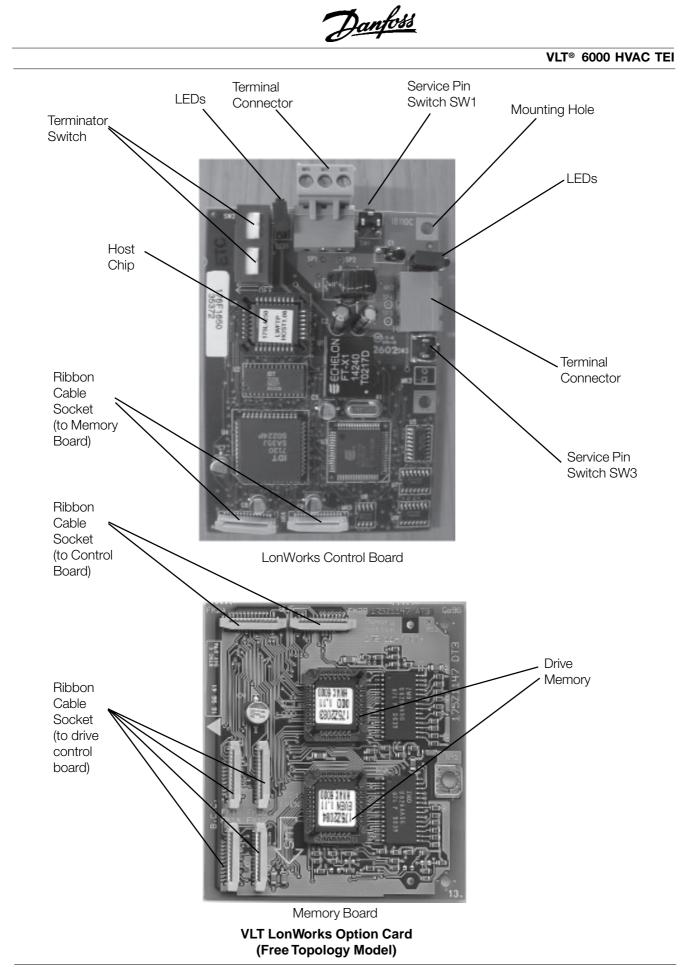

## ACAUTION

Electronic components of VLT frequency converter are sensitive to electrostatic dis-charge (ESD). ESD can reduce performance or destroy sensitive electronic components. Follow proper ESD procedures during installation or servicing to prevent damage.

## **ACAUTION**

It is responsibility of user or installer of VLT frequency converter to provide proper grounding and motor overload and branch protection according to National Electrical Code (USA) and local codes.

Tools Required Flat-head screw driver Torx T-10 screw driver Torx T-20 screw driver

Danfoss

## Installation Instructions

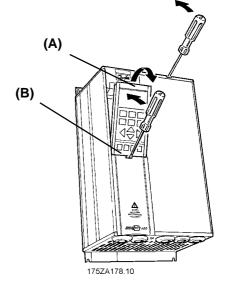

1. Access to Control Card Cassette

#### **IP20/NEMA 1 and Bookstyle**

- Remove Local Control Panel (LCP) by pulling out from top of display (A) by hand. LCP connector on panel back will disconnect.
- Remove protective cover by gently prying with a screw driver at notch (B) and lift cover out of guide pin fittings.

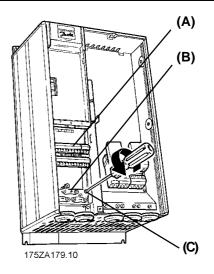

#### **IP54/NEMA 12**

- Open front panel of drive by loosening captive screws and swing open.
- Disconnect Local Control Panel (LCP) cable from drive control card.

## 2. Disconnect Control Card Cassette

- Remove control wiring by unplugging connector terminals (A).
- Remove grounding clamps (B) by removing two screws holding each in place. Save screws for reassembly.
- Loosen two captive screws (C) securing cassette to chassis.

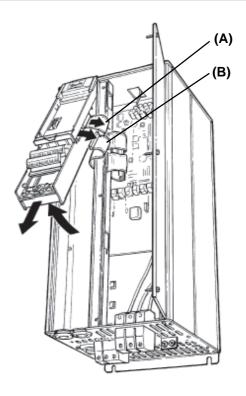

Danfoss

3. Remove Cassette and Ribbon Cables

- Lift control card cassette from bottom.
- Unplug two ribbon cables (A) and (B) from control board.
- Unhinge cassette at top to remove.

#### NOTE

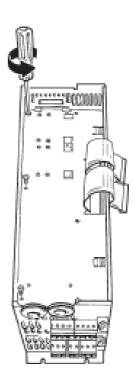

Ribbon cables will need to be reconnected to same connections from which removed.

## 4. Chassis Ground Connections

#### NOTE Ground strips are used on 208 V drives of 22 kW (30 HP) or less and on 460 V drives of 45 kW (60 HP) or less. For all other drives, go to step 6.

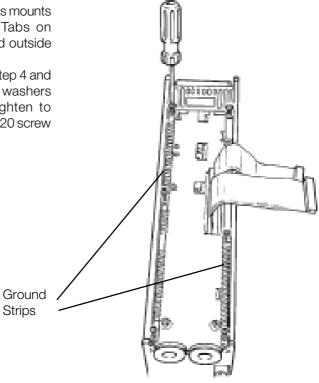

• Location of holes to mount grounding strips can vary with drive configuration. When applicable, remove mounting screws and washers located in chassis using Torx T-20 screw driver and save for reassembly. Otherwise, grounding strips attach with screws and washers provided, as shown in step 5.

## 5. Install Chassis Ground Connections

- Align ground strips over screw holes. Strip with fewest contact points mounts on cable side of chassis. Tabs on grounding strips point toward outside of chassis.
- Replace screws removed in step 4 and add additional screws and washers provided, as necessary. Tighten to 0.9 Nm (8 in-lbs) using Torx T-20 screw driver.

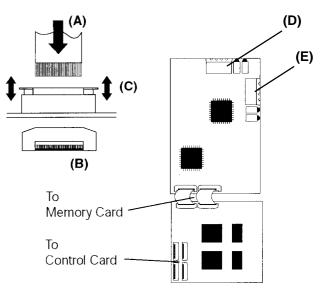

6. Install Ribbon Cables between Option Cards

- Attach ribbon cables between LonWorks control card and memory card.
- Be sure exposed wire portion of ribbon cable (A) is facing front of socket (B). Do not remove blue insulation covering end of ribbon cable.
- Pull up collar (C) of ribbon cable socket, insert cable and push collar closed.
- Repeat procedure for all ribbon cables.

#### IP20/NEMA 1 and IP54/NEMA 12

• Remove terminal connector from terminal block (D) and connect to terminal block (E) at this time for ease of access.

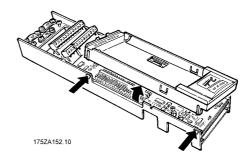

Danfoss

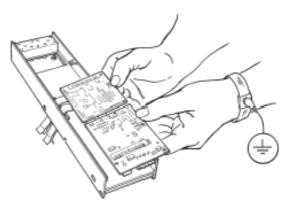

VLT® 6000 HVAC TEI

7. Remove LCP Cradle

- IP20/NEMA 1 and Bookstyle
- Carefully push in tabs at corners of LCP cradle to release clips. Pull out to disengage clips and lift cradle free.

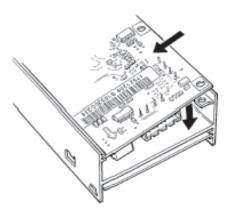

- 8. Ribbon Cable Routing
- Route ribbon cables from LonWorks memory card through slot at side of control board cassette.

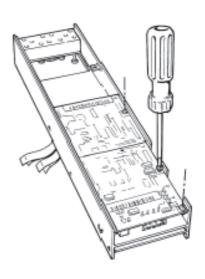

9. Insert LonWorks Card

 Insert edge of LonWorks cards into slot in side of cassette and align screw holes.

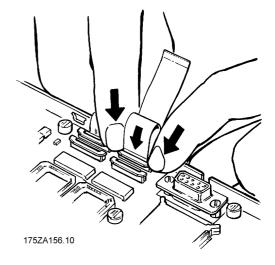

<u>Danfoss</u>

10. Secure LonWorks Card • Secure LonWorks card with 3 self-tapping screws and washers provided using Torx T-10 screw driver. Tighten to 8 in-lbs (0.9 Nm).

11. Install Ribbon Cable on VLT Control Board

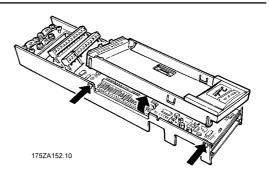

- Be sure not to twist or crimp ribbon cables.
- Insert cables into corresponding sockets and fasten in accordance with directions in step 5.

12. Install LCP Cradle

#### IP20/NEMA 1 and Bookstyle

- Insert cradle clips into holes in cassette.
- Push down on cradle to snap it into place.

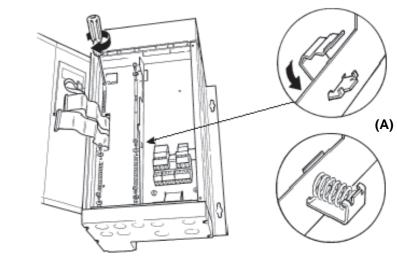

Danfoss

13. Install Spring Tension Clip

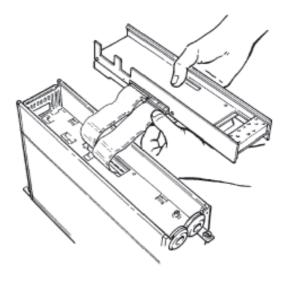

#### IP20/NEMA 1 and IP54/NEMA 12

- Spring tension clip (A) is used as a cable strain relief and ground point for shielded cable.
- Insert clip through inner wall of chassis at slot provided.
- Compress spring into clip at outer wall of chassis.

- 14. Install Ribbon Cables
- Connect ribbon cables.
- Connect control card cassette to hinge at top of drive and fit into chassis.

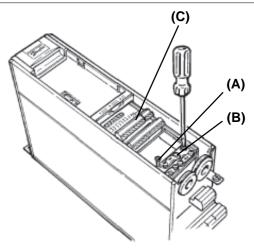

NOTE Ribbon cables must be reconnected to same connections from which removed.

## 15. Install Control Card Cassette

- Fasten control card cassette by alternately tightening two captive screws (A). Tighten to 0.9 Nm (8 in-lbs).
- Route control wires through clamp fasteners (B) and secure clamps with two screws.
- Connect control terminals (C) by firmly pressing them into connector receptacles.

## 16. Plug in Terminal Connector

• Connect signal wire NET A to terminal 79 and NET B to 80 of terminal connector. (In free topology model, connections can be reversed.)

#### IP20/NEMA 1 and IP54/NEMA 12

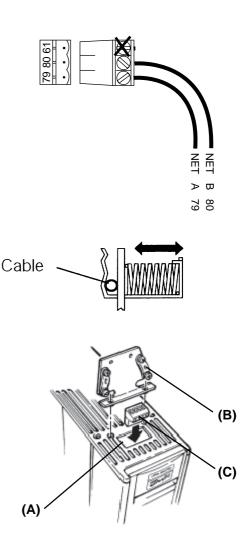

- Plug network connector into terminal block at side of control card cassette.
- Insert LonWorks cable between inner wall of chassis and spring tension clip.

### NOTE

Shielded cable is recommended. Ground shielded cable at spring tension clip location or ground at cable clamp by removing cable insulation at contact point. Do not use connector terminal 61.

### Bookstyle

- Remove knockout from top of drive (A).
- Route control wires through clamp fasteners (B) on cable plate and secure clamps with screws. Tighten to 0.9 Nm (8 in-lbs).
- Secure cable plate to drive with screws and screw holes provided. Tighten to 0.9 Nm (8 in-lbs).
- Plug network connector (C) into terminal block at top of control card cassette.

Dantoss

## Network Initialization of LonWorks Option Card

Resource

files

The LonWorks option card contains a NEURON chip with a unique address. After hardware installation, initialize the LonWorks option card. Addressing nodes on the LonWorks network is performed at installation time by an installation tool or network management tool. Addressing requires the retrieval of a node's NEURON ID. The NEURON ID is a 48 bit number that identifies every manufactured NEURON chip. There are several methods by which the network software will initialize the drive automatically. The network can recognize the drive without action beyond proper installation. The card is then ready to be programmed for network operation. The VLT LonWorks option supports three additional methods of addressing a node:

1. Service Pin - There are two momentary-contact service switches that send the NEURON ID over the network. If the network software prompts the action, press

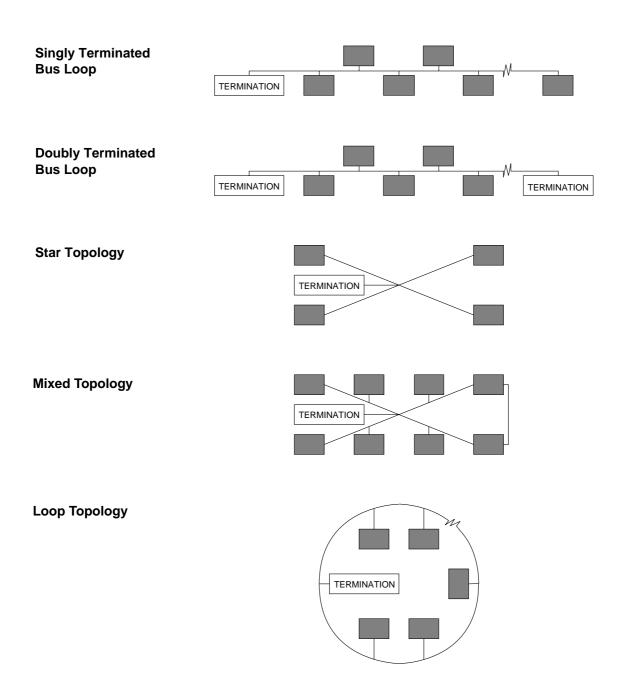

A LonMark interface file (.XIF extension) provides the host processor with device information. With this, it is possible to design a LonWorks network without the frequency converter being physically present. Please contact your local Danfoss supplier. either service pin (SW1 or SW3) to transmit the NEURON ID over the network. The service pin locations are shown in the illustration in *Terminator and Service Switch Locations* in this manual.

2. Query and Wink - The LonWorks option card is shipped with a domain of "0" and subnet of "1." Upon receiving the wink command, the on-board green status LED flashes so that the installer can locate the node. The chip sends out its Neuron ID over the network in response to the query command.

3. *NEURON ID Label* - The VLT LonWorks option card has a NEURON ID label that displays the NEURON ID as a 12 digit hexadecimal number. The installer can manually enter the NEURON ID during installation.

Danfoss

Free Topology Network Configuration The Free Topology Transceiver (FTT) system is designed to support free topology wiring and accommodates bus, star, loop or any combination of these topologies. The FTT transceiver located on the VLT LonWorks option card provides I/O functions. Flexible wiring capability simplifies system installation and makes it easy to add nodes for system expansion. The figures below represent five network topologies.

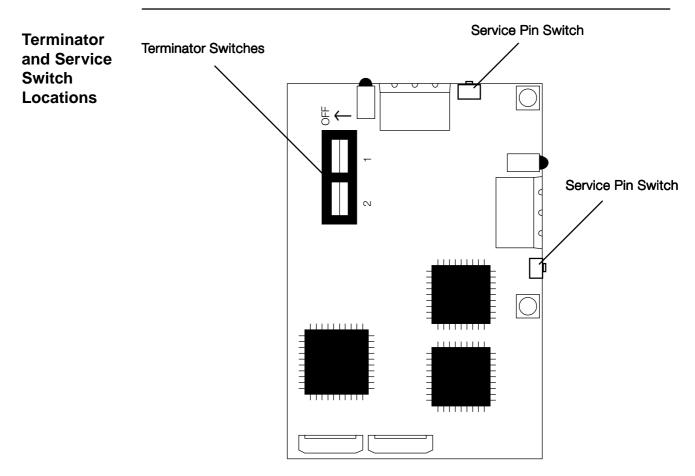

Danfoss

## Network Termination Option

The option of using termination on the LonWorks card is provided. The option card has a termination resistor built-in which is activated by the terminator switches. Use of the terminator is optional, depending upon the network configuration. If termination is provided elsewhere in the network, the termination function should be OFF. Terminator switches position functions are provided in the table below.

## **Switch Position Functions**

Termination	Pos 1	Pos 2
No termination	Net Term OFF	Net Term OFF
	(Factory setting)	(Factory setting)
Single termination	Net Term ON	Net Term OFF
Double termination	Net Term ON	Net Term ON

LonWorks Card Diagnostic LEDs The LonWorks board includes two LEDs to display the communication status of the board, display the state of the NEURON chip, and respond to the network management

"wink" command. The onboard LEDs are the Service LED (LED 1, red) and the Status LED (LED 2, green).

### Status LED The Status LED patterns are:

#### ON

There is power on the board but there has not been any communication to an input network variable in the last 2 seconds.

#### Flashing 10 times per second

There is regular network communication to the VLT's input network variables.

#### Flashing intermittently

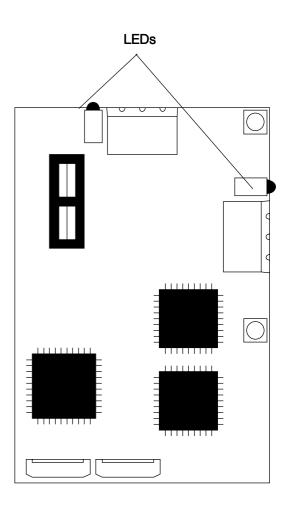

There is network communication to the VLT's input network variables but input network variables are received at a period greater than 2 seconds.

#### Flashing 5 times per second

The response to the network management "Wink" command. The VLT LonWorks node must be reset to leave the wink state.

#### OFF

No power on board or hardware fault.

## Service LED

The Service LED displays the state of the NEURON chip. The following table shows the Service LED patterns for various states and defines their meaning.

Danfoss

## Service LED Patterns and Descriptions

LED Pattern	Operation	Description
Continuously ON	Power-up of Neuron 3120xx chip-based node or Neuron 3150 chip-based node with any PROM	Use EEBLANK and follow reinitialization procedure.
Continuously OFF	Power-up of Neuron 3120xx chip-based node or Neuron 3150 chip-based node with any PROM	Indicates bad node hardware.
ON for one second at power-up followed by approximately 2 seconds OFF, then stays ON	Power-up/Reset	May be caused by Neuron chip firmware when mismatch occurs in application checksum.
Short flash every 3 seconds	Anytime	Indicates watchdog timer resets occurring.
		Possible corrupt EEPROM.
		For Neuron 3150 chip-based node, use EEBLANK and follow reinitialization procedure.
Flashing at 1 second intervals	Anytime	Indicates node is unconfigured but has an application. Proceed with loading node.
Brief flash at power-up. OFF duration approximately 10 seconds after which stays ON	Using EEBLANK or Neuron 3150 chip-based node	Indicate completion of blanking process.
Brief flash at power-up. OFF duration approximately 1 to 15 seconds, depending on application size and system clock. LED then begins flashing at 1 second intervals.	First power-up with new PROM on Neuron 3150 chip- based custom node. Unconfigured firmware state exported.	Indicates unconfigured state.
Brief flash at power-up followed by OFF		Node is configuring and running normally.

## Service LED Pattern Descriptions

Danfoss

## Network Drive Control Input

The most common functions for controlling the VLT frequency converter from the LonWorks network are made readily available. Those functions and their descriptions are presented in the table below. The control word function accesses additional drive capabilities for network control.

The choice of open loop or closed loop operation of the drive is selected in parameter 100, *Configuration*.

Using nviRefPcnt, the drive's reference is expressed as a percentage of the reference range. The range is set using parameters 204, *Min. Reference* and 205, *Max. Reference*. In open loop operation, reference represents the drive's desired output speed. In this case, set *Min. Reference* to 0 Hz and *Max. Reference* equal to *Max. Frequency* in parameter 202.

In closed loop operation, reference represents the desired setpoint. It is recommended that parameters 204 and 205 be set equal to parameters 201, *Min. Frequency* and 202, *Max. Frequency*. All references provided to the drive are added to the total reference value. If reference is to be controlled by the LonWorks bus only, ensure that all other reference inputs are zero. This means that digital input terminals and analog input terminals should not be used for reference signals. The default setting (0%) should be maintained for preset references in parameters 211 (215) through 214 (218). Also, in closed loop operation, the default setting (0.0) should be maintained for drive setpoints in parameters 418 (215) and 419 (218).

#### Start/Stop and Reset fault

SNVT\_lev\_disc. ST\_OFF and ST\_NUL are interpreted as low or "0." ST\_LOW, ST\_MED, ST\_HIGH, and ST\_ON are interpreted as high or "1."

NOTE To optimize network performance and for proper drive operation, use only one of following input reference commands.

#### Reference 1

Network variable nviRefPcnt is a signed value. It represents the desired percentage of the VLT drive's reference range. Range: -163.840 - 163.835.

Danfoss

## Network Variable Inputs to VLT

					VLT

## Network

Drive Control Input

#### Reference 3

Network variable nviRefHz is an unsigned value. It represents the output frequency of the drive in Hz in open loop. It is rarely used in (continued) closed loop mode.

Range: 0 - 6553.5.

#### Control Word

The input network variable nviControlWord is a 16-bit word that provides additional operational control of the drive, as listed in the table below. The settings shown represent the Coast Stop command

Bit	Setting	0	1
00	0	Prese	t Ref. LSB
01	0	Preset	t Ref. MSB
02	1	DC Brake	no DC Brake
03	0	Coast Stop	no Coast Stop
04	1	Quick Stop	no Quick Stop
05	1	Freeze Freq.	no Freeze Freq.
06	0	Ramp Stop	Start
07	0	no Reset	Reset
08	0	no Jog	Jog
09	0	no function	
10	1	see par. 805	
11	0	Relay 1 OFF	Relay 1 ON
12	0	Relay 2 OFF	Relay 2 ON
13	0	Setup LSB	
14	0	Set	up MSB
15	0	no Reversing	Reversing

#### **Control Word Bit Descriptions** for Coast Stop

The equivalent control word bit settings to start and stop the drive (nviStartStop) and to reset after a fault (nviResetFault) are described in the table below.

	nvi Sta	artStop	nviRe	setFault	
Bit	0	1	0	1	Description
00	0	0		0	Preset Ref. LSB
01	0	0	ą	0	Preset Ref. MSB
02	1	1	vor	1	No DC Brake
03	1	1		1	No Coast Stop
04	1	1	ntr	1	No Quick Stop
05	1	1	8	1	No Freeze Freq.
06	0	1	he	0	Start
07	0	0	to t	1	Reset
08	0	0	. ue	0	Jog
09	0	0	ritte	0	No function
10	1	1	× ≈	1	Bit 10
11	0	0	6.	0	Relay 1 On
12	0	0	alu	0	Relay 2 On
13	0	0	No value is written to the control word	0	Setup LSB
14	0	0	Ž	0	Setup MSB
15	0	0		0	Reversing

#### Start/Stop and Fault Reset Control Word **Bit Descriptions**

#### NOTE

Drive always stops and ignores serial bus commands to run when **OFF/STOP** or **STOP/RESET** function is activated from drive keypad.

VLT 5000 parameters are shown in parenthesis, where applicable.

Danfoss

Precedence of the stop commands is:

- -
  - Coast stop
     Quick stop
  - 3. DC brake stop
  - 4. Ramp stop

#### Coast stop

The drive output stops immediately and the motor coasts to a stop.

- Drive display show UN.READY (unit ready) when coast stop is active.
- Drive cannot run in any mode.
- Parameter 503 (502), *Coasting stop*, determines interaction with input 27.

#### Quick stop

The drive output frequency ramps down to 0 Hz according to time set in parameter 207 (212), *Ramp Down Time*.

- Drive display shows STOP.
- Drive cannot run in AUTO mode but can run in HAND mode.

#### DC brake stop

The drive brakes the motor to a stop using DC injection braking.

- Parameters 114 (125) and 115 (126) determine amount and time of DC current applied for braking.
- Drive display shows DC STOP.
- Drive cannot run in AUTO mode but can run in HAND mode.
- Parameter 504, *DC Brake*, determines interaction with input 27.

#### Ramp stop

The drive output frequency ramps down to 0 Hz according to time set in parameter 207, *Ramp Down Time*.

- Factory setting is 60 sec for fan applications and 10 sec for most pump applications.
- Drive display shows STAND BY.
- Drive can run in HAND mode or AUTO through a digital input command.
- Parameter 505, *Start*, determines interaction with input 18.

Drive Speed Setpoint

With this input variable it is possible to give the Drive a Start/stop signal and a reference.

#### State | Ref. value | Command

0	-	Stop
1	0	Run, Ref. = 0%
1	0-100%	Run, Ref. = 0-100%
0xFF	-	Auto (invalid)

Default is Auto.

#### Analog output 42/45

With this input variable it is possible to control the analog output 42/45 in the range from 0-100%. To control the analog output parameter 319/321 *Signal Output 42/45* should be programmed to one of the following selections:

- Bus control 0-20 mA [44]
- Bus control 4-20 mA [45]
- Bus control Pulse [46]

Danfoss

## Drive Feedback to Network

The VLT LonWorks option provides 22 output variables to the network containing important drive and motor feedback data. Feedback data is sent when there is a change in value. The VLT LonWorks option will only transmit bound network variables. Since some data changes continuously, the transmission rate of those variables is limited. *Min send time* specifies the minimum time between transmissions of variables.

The Drive Output 1 will have a maximum time between transmission set by the *Max send time*. This function acts as a transmit heartbeat and allows a controller node to determine the health of the controller/VLT connection. The *Max send time* function is disabled when the configuration network variable nciMaxsendT is not configured or is set to "0."

#### Network Variable Outputs from VLT

#### Drive status

NvoDrvStatus, nvoStatusWord, nvo-Digitallnput, nvoAlarmWord, nvoWarning1 and nvoWarning2 are all 16 bit Boolean values using the SNVT\_state variable type. Individual bits represent specific drive status states. The tables provided in *Drive Status Bit Definitions* define each bit.

#### Drive output 1

Network variable nvoOutputPcnt provides an analog indication of drive operation. In open loop, this is the drive output frequency in percentage within the reference range. To avoid negative numbers, or numbers above 100%, set parameter 204, *Min. Reference* to 0 Hz, and parameter 205, *Max. Reference* equal to parameter 202, *Max. Frequency*.

In closed loop, this is the drive's feedback signal within the reference range. For best operation, set *Min. Reference* to equal parameter 413 (414), *Min. Feedback*, and *Max. Reference* to equal parameter 414 (415), *Max. Feedback.*

<sup>1</sup> 78 kbps transformer coupled twisted pair and 78 Kbps free topology transceiver models.

<sup>2</sup> 1.25 Mbps transformer coupled twisted pair transceiver model.

#### **Network Timer Functions**

#### Min send time

Sets the minimum period between transmissions for all output network variables, using the network variable nciMinSendT. This function is used to keep the transmission of variables that change continuously from dominating the network communication.

#### Max receive time

This drive function is replaced by the value set in parameter 803, *Bus Time Out.* The LonWorks option will initiate bus time out activities when the time set in parameter 803 expires without receiving an input network variable directed to the drive. This acts like a LonWorks receive heartbeat. The action taken by the drive is determined by the setting selected in parameter 804, *Bus time out function.* See the parameter description section of this manual. The value of nciMaxReceiveT has no effect on the operation of the drive.

#### Max send time

This function sets the maximum time between transmissions for the network variables Drive Output 1, 2, and 3 using the configuration network variable nciMaxSendT. It can be used by the controller to monitor the health of the VLT and controller connection. It acts like a LonWorks send heartbeat.

The *Max send time* function is disabled when nciMaxSendT is not configured or set to "0."

Dantoss

## VLT Parameter Access

A controller node can monitor or modify any VLT parameter by supporting the *Parameter access command* and the *Parameter access response* functions. These functions allow a controller complete access to the features of the VLT and the ability to configure drives with predefined settings, using the network variables nviParamCmd and nvoParamResp.

The following definitions describe how the fields of SNVT\_preset are used by the VLT LonWorks option:

#### Learn

This field contains the function code for the VLT. The values for this field are:

LN\_RECALL (0), LN\_LEARN\_CURRENT (1), LN\_LEARN\_VALUE (2), and LN\_REPORT\_VALUE (3).

LN\_RECALL (0) and LN\_REPORT\_VALUE (3) are interpreted as read commands.

LN\_LEARN\_CURRENT (1) and LN\_LEARN\_VALUE (2) are interpreted as write commands.

Any other value in this field will result in an error message in the *Parameter access* response.

#### Selector

This field contains the VLT parameter number, written in decimal notation, that is to be written or read. Requests for undefined parameters will result in an error message in the *Parameter access esponse*. The controlling device should compare the parameter number of the response message to the requested parameter number to determine that the information received is the requested information and not a response to another controller or from another VLT.

#### Value

This array contains the parameter information to and from the VLT. All VLT parameters use 16 bit signed or unsigned values. The most significant 2 hex bytes of data will be stored in value [0] and the least significant 2 hex bytes of data will be stored in value [3]. In the event of an error message, the VLT will send 0xff in value [0] and an error code in value [3]. The error codes are defined in the section *Parameter Access Error Codes* in this manual.

#### NOTE

#### Consult *Conversion Index* in the VLT Instruction Manual parameter table for correct conversion factor for reading and writing to and from drive.

Day, Hour, Minute, Second, Millisecond The time fields are not supported by the VLT LonWorks option. The VLT will respond to parameter access requests as soon as they are received. Any values in the time fields of the *Parameter access command* will be ignored. All time fields will be set to "0" in the *Parameter access response*.

Function	SNVT type	Variable Name
Parameter access command	SNVT_preset	nviParamCmd

#### **Network Variable Input to VLT**

Function	SNVT type	Variable Name
Parameter access response	SNVT_preset	nvoParamResp

#### Network Variable Output from VLT

## VLT® 6000 HVAC TEI

Danfoss

Parameter Access Error Codes In the event of an error message in response to a *Parameter access command* (see VLT Parameter Access), the VLT sends 0xff in value bit [0] and an error code in value [3]. Error code definitions are presented in the table below.

#### **Parameter Access Error Codes**

Exception Code	Interpretation
1	Illegal function for the addressed node
2	Illegal data address (i.e., illegal parameter number)
3	Illegal data value
6	Busy

## Parameter Access Command and Response Examples

The examples below demonstrate use of the *parameter access command* and *parameter access response* functions of the controller node. In the examples, the controller node has a *parameter access command* SNVT\_preset called nvoParamCmd and a *parameter access response* SNVT\_preset called nviParamResp. In writing to the drive correctly, the access response simply repeats the entered data. In the event of an error, an error code is displayed in value [3]. See *Parameter Access Error Codes* above.

## 

Parameter 971 must be set to STORE ACTIVE SETUP for entering data values through LonWorks *parameter access command* in order to save changes in drive. See parameter 971 in *Parameter Descriptions* section of this manual.

#### NOTE

Consult conversion index in the *VLT Instruction Manual* parameter table for correct conversion factor for reading and writing to and from drive.

**Example 1:** The controller node writes 30 seconds to parameter 206 (205), *Ramp time up* of the VLT. Conversion index is 0, so the conversion factor is 1.0 (VLT 5000 conversion factor -2)).

The controller node access command sends the following parameter write request to the VLT.

nvoParamCmd.learn= LN\_LEARN\_CURRENT nvoParamCmd.selector = 206 nvoParamCmd.value[0] = 0 nvoParamCmd.value[1] = 0 nvoParamCmd.value[2] = 0 nvoParamCmd.value[3] = 1E hex (30 decimal) The controller node receives the following parameter access response from the VLT.

nviParamResp.learn = LN\_LEARN\_CURRENT nviParamResp.selector = 206 nviParamResp.value[0] = 0 nviParamResp.value[1] = 0 nviParamResp.value[2] = 0 nviParamResp.value[3] = 1E hex nviParamResp.day = 0 nviParamResp.hour = 0 nviParamResp.minute = 0 nviParamResp.second = 0 nviParamResp.millisecond = 0

Dantoss

#### VLT<sup>®</sup> 6000 HVAC TEI

- A controller node writes 18.0 Hz to VLT Example 2: The controller node receives the following parameter 201, Output Frequency Low Limit. parameter access response from the VLT. The conversion index is -1, so the conversion factor is 0.1. nviParamResp.learn = LN LEARN CURRENT The controller node sends the following nviParamResp.selector = 201 nviParamResp.value[0] = 0parameter write request to the VLT. nviParamResp.value[1] = 0 nvoParamCmd.learn = nviParamResp.value[2] = 0 LN LEARN CURRENT nviParamResp.value[3] = B4 hex nvoParamCmd.selector = 201 nviParamResp.day = 0nvoParamCmd.value[0] = 0nviParamResp.hour = 0nvoParamCmd.value[1] = 0 nviParamResp.minute = 0nvoParamCmd.value[2] = 0 nviParamResp.second = 0nvoParamCmd.value[3] = B4 hex (180 nviParamResp.millisecond = 0decimal) A controller node writes [2] (REFERENCE Time 1 - The controller node receives the Example 3: [UNIT]) to parameter 007 (009), Large Display following parameter access response from the Readout, of the VLT. VLT. The controller node sends the following nviParamResp.learn = parameter write request to the VLT. LN LEARN CURRENT nviParamResp.selector = 7nvoParamCmd.learn = nviParamResp.value[0] = 0LN LEARN CURRENT nviParamResp.value[1] = 0nvoParamCmd.selector = 7nviParamResp.value[2] = 0nvoParamCmd.value[0] = 0nviParamResp.value[3] = 2nvoParamCmd.value[1] = 0 nviParamResp.day = 0nvoParamCmd.value[2] = 0 nviParamResp.hour = 0nvoParamCmd.value[3] = 2 nviParamResp.minute = 0nviParamResp.second = 0nviParamResp.millisecond = 0 Example 4: A controller node reads the value of parameter The controller node receives the following 407 (411), Switching Frequency, in the VLT. parameter access response from the VLT. The value stored in parameter 407 is 10 kHz. The conversion index is 2, so the conversion nviParamResp.learn = LN RECALL nviParamResp.selector = 407 factor is 100. nviParamResp.value[0] = 0 nviParamResp.value[1] = 0 The controller node sends the following parameter read request to the VLT. nviParamResp.value[2] = 0nviParamResp.value[3] = 64 hex (100 nvoParamCmd.learn = LN RECALL decimal) nvoParamCmd.selector = 407 nviParamResp.day = 0nvoParamCmd.value[0] = 0nviParamResp.hour = 0nvoParamCmd.value[1] = 0 nviParamResp.minute = 0nviParamResp.second = 0nvoParamCmd.value[2] = 0 nvoParamCmd.value[3] = 0
  - nviParamResp.millisecond = 0

Danfoss

Example 5:

A controller node error is written to VLT parameter 201, *Output Frequency Low Limit,* with 80.0 Hz when the high limit is 60 Hz. The conversion index is -1, with conversion factor 0.1.

The controller node sends the following parameter write request to the VLT.

nvoParamCmd.learn = LN\_LEARN\_CURRENT nvoParamCmd.selector = 201 nvoParamCmd.value[0] = 0 nvoParamCmd.value[1] = 0 nvoParamCmd.value[2] = 3 hex nvoParamCmd.value[3] = 20 hex (800 decimal)

Standard Object Support The VLT LonWorks option supports two standard objects and three SNVTs, per the LonMark standard object philosophy. The standard objects are the *Node Object* (containing the *Object request, Object status,* and *Object alarm*) and the *Controller object*, (containing the network variables described in the preceding sections). The *Object request* is a LonMark device used to obtain status and alarm information from a node.

It is not necessary for a controller to support the *Node Object* network variables. The *Object request, Object status* and *Object alarm* provide status and alarm information for controllers that only support this type of functionality. The status and alarm functions described in the preceding sections contain more drive specific information than *Object status* and *Object alarm*.

1. The VLT sends an *Object status* containing drive status information and an *Object alarm* containing fault informationin response to the following *Object requests*: RQ\_NORMAL, RQ\_UPDATE\_STATUS, and RQ\_UPDATE\_ALARM. The controller node receives the following parameter access response from the VLT.

nviParamResp.learn = LN\_NULL nviParamResp.selector = 201 nviParamResp.value[0] = 0 nviParamResp.value[1] = 0 nviParamResp.value[2] = 0 nviParamResp.value[3] = 3 (illegal data value) nviParamResp.day = 0 nviParamResp.hour = 0 nviParamResp.minute = 0 nviParamResp.second = 0 nviParamResp.millisecond = 0

The nviRequest.object\_id should be set to "1" (controller node). The network uses nviRequest, nvoStatus and nvoAlarm variables for these functions.

- 2. The VLT sends an *Object status* containing a bit map of supported status fields in response to all other *Object requests,* including undefined requests.
- 3. The VLT *Object status* supports the following status fields: invalid\_id, invalid\_request,open\_circuit, out\_of\_service, electrical\_fault, comm\_failure, manual\_control, and in\_alarm. All other fields are always set to "0."
- 4. The VLT sends an *Object alarm* following any set or reset of a drive fault condition.
- 5. The *Object alarm* supports the AL\_ALM\_CONDITION and AL\_NO\_CONDITION alarm types.

Function	SNVT type	Variable Name	Input/Output
Object request	SNVT_obj_request	nviRequest	Input
Object status	SNVT_obj_status	nvoStatus	Output
Object alarm	SNVT_alarm	nvoAlarm	Output

## **VLT 6000** Alarm Descriptions

Alarm numbers and descriptions that correspond to nvoAlarmWord bit numbers are

shown in the table below. See the VLT 6000 Operating Instructions for more details.

Bit number	Alarm number	Alarm Description
2	22	AMA failed
3	18	HPFB timeout
4	17	Serial communication timeout
5	16	Short circuit
6	15	Switch mode fault
7	14	Ground fault
8	13	Overcurrent
9	12	Current limit
10	11	Motor thermistor
11	10	Motor overtemperature
12	9	Inverter overload
13	*8	Undervoltage
14	**7	Overvoltage
15	4	Mains failure

\* also bit 10 of nvoWarning 1
\*\* also bit 11 of nvoWarning 1

#### Parameter List

				Conversion	Data
PNU	Parameter Description	Default Value	Range	Index	Туре
803	Bus time out	1 sec	1 - 99 sec.	0	3
804	Bus time out function	no function		0	3
805	Bit 10 function	Bit 10 = > CTW ACT		0	6
927	Parameter edit	Enable		0	6
928	Process control	Enable		0	6
970	Edit setup	Active Setup		0	5
971	Store data values	no action		0	5

In addition to the parameters listed above, the drive's control terminals issue digital inputs that control functions similar to those provided by nviStartStop, nviResetFault, and nviControlWord. Parameters (502) 503 through 508 determine how the drive

responds to commands for (quick stop, VLT 5000 only), coasting stop, DC brake, start, reverse, setup select and preset reference select. See *Network Drive Control Input* in this manual and the *VLT Instruction Manual* for more information.

## Parameter Descriptions

#### 803 Bus time out

Selection: 1 - 99 sec

★ 1 sec

Function: Sets the duration for the bus time out function. If the set time passes without the drive receiving a LonWorks message addressed to it, the drive will take the action specified in parameter 804, *Bus Time Out Function.* 

NOTE After time out counter is reset it must be triggered by valid control word before new time out can be activated.

★ Factory setting

Danfoss

804 Time out function	Selection:	
Time out function	★ Off (NO FUNCTION)	[0]
	Freeze output frequency (FREEZE OUTPUT FREQ.) Stop with auto restart	[1]
	(STOP) Output frequency = JOG freq.	[2]
	(JOGGING) Output frequency = Max. freq.	[3]
	(MAX SPEED) Stop with trip	[4]
	(STOP AND TRIP) Control without DeviceNet	[5]
	(NO COM OPT CONTROL)	[6]
	Select set-up 4 (SELECT SET UP 4)	[7]
	Function: The time out timer is triggered at the first reception of a valid control word, i.e., bit 10 = ok.	
	The time out function can be activated in different ways:	ı two

- 1. The drive does not receive a LonWorks command addressed to it within the specified time.
- 2. Parameter 805 is set to "bit 10 = 0time out" and a control word with "bit 10 = 0" is sent to the drive.

The VLT remains in the time out state until one of the following four conditions is true:

- A valid control word (Bit 10 = ok) is received <u>and</u> the drive is reset through the bus, the digital input terminals or the local control panel. (Reset is only necessary when the time out function *Stop w/trip* is selected.) Control via LonWorks is resumed using the received control word.
- 2. Local control via the local control panel is enabled.
- Parameter 928, Access to process control, is set to Disabled. Normal control via the digital input terminals and the RS-485 interface is now enabled.

is set to <i>Off.</i>
Control via LonWorks is resumed and
the most recent control word is used.
Description of Selections:
• Freeze output frequency. Maintain
present output frequency until
communication is resumed.
<ul> <li>Stop with auto restart. Stop and</li> </ul>
automatically restart when
communication is resumed.
<ul> <li>Output frequency = JOG freq. Drive</li> </ul>
will produce JOG frequency set in
parameter 209 (213), Jog frequency,
until communication is resumed.
<ul> <li>Output frequency = Max. freq. Drive</li> </ul>
will produce maximum output

4. Parameter 804, Bus time out function,

- Output frequency Max. freq. bive will produce maximum output frequency (set in parameter 202, Output frequency) until communication is resumed.
- *Stop with trip.* Drive stops and requires a reset command before it will restart.
- Control without LonWorks. Control via LonWorks is disabled. Control is possible via digital input terminals and/or standard RS-485 interface until LonWorks communication is resumed.
- Select setup 4. Setup 4 is selected in parameter 002 (004), Active setup, and settings of setup 4 are used. Parameter 002 (004) is not reset to the original value when communication is resumed.

★ Factory setting

Danfoss

805 Control Word Bit 10 Function	<ul> <li>★ Bit 10 = 1: control word active (BIT 10 = 1 &gt;CTW ACTIVE) [' Bit 10 = 0: control word active (BIT 10 = 0 &gt;CTW ACTIVE) [' Bit 10 = 0: bus time out</li> </ul>	I and of thefunction. $and$ function. $bot f thebit 10 = 0 > CTW active. The controlaver = 0bit 10 = 0 > CTW active. The controlaver = 0vord and speed reference areall bits = 0ignored if bit 10 = 1. If all bits of theases, = 0vord are 0, the VLT reactionof bit = 0vord are 0$
927 Parameter edit		<ul><li>This parameter determines if LonWorks can</li><li>be used to access and edit drive parameters.</li></ul>
928 Process control		<ul> <li>[0] This parameter determines LonWorks control of the drive. When <i>Enable</i> is selected, drive parameters 503 through 508 determine the interaction between various LonWorks and digital drive input commands. See the <i>VLT Instruction Manual</i> for details.</li> </ul>
970 Edit setup select	Data Value: Preprogrammed (FACTORY SETUP) Setup 1 (SETUP 1) Setup 2 (SETUP 2) Setup 3 (SETUP 3) Setup 4 (SETUP 4) ★ Active Setup (ACTIVE SETUP)	<ul> <li>This parameter selects the setup being edited,</li> <li>through either the drive control panel or</li> <li>LonWorks. The drive may operate in one</li> <li>setup while editing another. <i>Active setup</i></li> <li>selects the parameter being edited as the</li> <li>setup controling drive operation.</li> </ul>
971 Store data value	Store all setups (STORE ALL SETUPS   Store edit setup (STORE EDIT SETUP)   Store active setup	<ul> <li>When this parameter is set to <i>Store active</i> setup, LonWorks downloaded parameters are written to EEPROM and stored. <i>Store edit</i> setup stores the setup selected in parameter 970. <i>Store all setups</i> stores all setups in parameter 970. When finished (appx. 15 sec.), it automatically returns to <i>No action</i>. Any parameters values written via the serial bus with <i>No action</i> selected are lost when power is removed from the drive. The function is only activated with the VLT in stop mode.</li> </ul>
