Operating Instructions 017193-1000

Level Probe multicap DC 21

Fully insulated rope probes

Applications

The Multicap DC 21 probe is designed for continuous level measurement in electrically conducting liquids and limit detection in all types of liquid. The wide selection of corrosion-resistant materials used for the probe rope, insulation and process connection ensures that the probe can withstand extremely corrosive products. The tried-and-tested, rugged construction is gas-tight for pressures from vacuum to 50 bar (725 psi) gauge. Seal and insulation materials enable it to be used with operating temperatures in the vessel of -80°C to +200°C $(-110^{\circ}\text{F to } +390^{\circ}\text{F}).$

Your benefits

- Optimum adaptation to your application thanks to a wide range of process connections and practical variations
 - = reliable function at a cost-effective price
- Protection against condensation in the nozzle
 - = reliable function even with condensation
- Active build-up compensation for limit detection
 - constant and accurate switchpoint even with heavy build-up on the probe, no cleaning or recalibration required

Measuring System

The measuring system comprises:

- Multicap DC 21 probe
- EC electronic insert in the probe housing
- Silometer FMC (Z) transmitter or Nivotester FTC (Z) level limit switch

For limit detection in liquids with heavy build-up or for detecting interface layers, the measuring system comprises:

- Multicap DC 21 probe with active build-up compensation
- EC 16 Z electronic insert
- FTC 520/521 Z or FTC 470/471 Z level limit switch. The limit input of the Silometer FMC 671 Z can also be connected.

Continuous measurement, e.g. using probe with screening against condensation in the nozzle

Two-point control

L00-DC21xxxx-14-05-xx-xx-00

Limit detection,

e.g. using probe with screening and active build-up compensation for reliable limit switching even in the presence of heavy build-up

Separate mounting of the electronic insert in the case of an excessively high ambient temperature at the probe head housing

Certified Applications

Please note that in addition to the instructions given in this Technical Information, the specifications in the certificates and relevant local regulations apply.

Operating Principle

The probe and vessel wall or counter-electrode form a capacitor with a defined, low capacitance when the probe is uncovered.

As soon as material covers the probe a parallel circuit is formed consisting of a much larger capacitance and the resistance of the material – the impedance.

This means that for materials with a conductivity which exceeds a specific, low threshold, any changes in dielectric constant and, therefore, in the capacitance no longer affect the measurement.

Screening on the probe prevents effects caused by build-up of material or condensation in the vicinity of the process connection. Probes with active build-up compensation for limit switching cancel out effects of build-up on the probe.

Equivalent circuit for capacitance measurement with fully insulated probes

Probe Selection

Here are a few notes on the various designs for the fully insulated Multicap DC 21 probe:

1. Basic probe

- for standard applications

2. Probe with screening

- for long nozzles
- when condensation forms on the roof of the vessel
- for build-up on the vessel wall, e.g. through splashing

3. Probe with fully insulated screening

- as above but for especially corrosive materials

4. Probe with active build-up compensation for limit detection

- for heavy (conductive) build-up on the probe.
- The active build-up compensation of the Multicap DC 21 probe is always gas-tight due to the self-adjusting tapered gasket.
 A wide range of corrosion-resistant materials ensures that the probe can be used in metallic tanks containing aggressive liquids.

5. Probe with gas-tight gland

- for liquefied gas tanks (required in Germany)
- to prevent condensation forming within the probe on extreme temperature variations. See temperature graphs overleaf.

Fully insulated rope probe versions

- a) Tensioning weight
- b) Anchor weight with insulated bore

6. Probe with temperature spacer

 for an extended range of operating temperatures in the vessel.
 See also temperature graphs.

7. Probe without electronic insert

 for high temperatures in the probe housing: use electronic insert in separate housing.
 See also temperature graphs.

8. Probe with protective cover (accessory)

 to prevent condensation forming in the aluminium housing.

Further variations outside the product tank

Electronic Insert

Separate or Built-In?

Information is provided by the graphs on the right.

The horizontal axis is the operating temperature $T_{\rm B}$ in the vessel.

The vertical axis is the ambient temperature T_U of the probe housing (in °C).

- Do the temperatures lie in the grey area of graph A?
 - The electronic insert may be mounted in the housing of any probe.
- Do the temperatures lie in the grey areas of graph B?
 - The electronic insert may be mounted in the housing of a probe with a temperature spacer or gas-tight gland; or it may be mounted in a separate housing.
- Do the temperatures lie in the grey areas of graph **C**?
 - The electronic insert should be mounted in a separate housing.
- Do the temperatures lie in the grey area of graph D?
- Use a probe with a temperature spacer or a gas-tight gland and mount the electronic insert in a separate housing.

Application range of the various types as a function of operating and ambient temperature

 $x \, ^{\circ}C = (x \cdot 1.8 + 32) \, ^{\circ}F$

Dimensions in mm (100 mm = 3.94 in / 1 in = 25.4 mm)

(Dimensions for the DC 21 with screening are shown in brackets)

Transport, Unpacking

- To avoid damage to the probe, remove the packaging on-site just before mounting.
 The uninsulated section of probes with active build-up compensation is covered with plastic webbing. This protection should be removed prior to mounting.
- Compare the code on the nameplate of the probe with the product designation on Page 12 to ensure that the correct probe has been delivered.

• Check the probe length. The probe rope can be shortened with the aid of the rope shortening kit (accessory).

Installation

- Probe with parallel thread G 1 ½ A:
 Use the elastomer/fibre seal provided or any other chemically resistant seal which can withstand temperatures up to 300°C (570°F).
- Probe with tapered thread 1 ½ 11 ½ NPT:
 If required, wrap suitable sealing material around the thread.
- Probe with flange connection:
 Use a sealing material suitable for the application. If the flange is PTFE-clad, then this is generally a suitable seal up to the permitted operating pressure.
- Make sure that the probe insulation is not damaged when sliding the probe through the threaded sleeve or nozzle with counter-flange.
- When tightening, turn the probe with threaded boss at the hex nut only; not at the housing!
- For probes with the G 1 ½ A thread and seal: a torque of only 300 Nm is sufficient to seal tight against a pressure in the vessel of up to 50 bar (725 psi). Maximum admissible torque: 600 Nm.
- A polypropylene threaded boss with rubber seal may only be tightened using a max. torque of 7 Nm (1 Nm = 0.74 ft lbs).
- If the probe is to be anchored, where possible use an insulated rope, tension to a maximum force of 200 N (20 kg/44 lbs).

Rotating the Housing

L00-DC21xxx-11-05-xx-xx-00

- 1) The housing can be rotated after the 3 nuts have been loosened
- 2) Tighten electronic insert (a) with the central slotted nut (b) leaving space (c) for the connecting cable

The housing can be rotated if the cable gland is pointing in the wrong direction after mounting.

To loosen: - Unscrew the housing cover

- Unscrew the central nut (slotted nut) in the electronic housing
- Remove the electronic insert from the housing
- Slightly loosen the 3 nuts (7 AF), see Figure.

To rotate: The housing can now be rotated in any direction.

To tighten: – Securely tighten the 3 nuts in the housing so that the housing is tight against the hex nut.

 Insert the electronic insert and securely tighten the central nut so that it does not become loose. Ensure that the cable gland remains free.

Connection

Refer to the appropriate Technical Information concerning the electronic insert EC used in the probe housing.

In the case of the heavy duty housing, the connection diagram corresponds to that of the built-in electronic insert. It is important that no moisture enters the probe housing during storage of the probe, connection of the electronic insert and during operation. Always tighten the housing cover and cable gland securely.

If the probe is installed in a plastic tank, connect the ground terminal of the probe to the counterelectrode using a short cable.

Replacing components

Mounting without electronic insert **Exchange of electronic** inserts

- After the defective electronic insert has been removed and the replacement properly installed, the instrument must be recalibrated and checked for correct function.
- If fully insulated multicap probes are mounted in explosion hazardous areas without the electronic insert, and there is a risk of dangerous electronic discharges, then the probe terminal in the housing must be short-circuited with the ground terminal.

Technical Data

Operating Data

- See graphs for the relationship between operating pressure and temperature.
- Capacitance values of the probe Basic capacitance: approx. 30 pF

Other capacitance values: Gas-tight gland: approx. 20 pF Temperature spacer: approx. 20 pF Active build-up compensation:

approx. 10 pF

Screening: approx. 3 pF/100 mm

Fully insulated screening: approx. 6 pF/100 mm

Probe 250 mm from a conductive vessel wall:

Insulated probe rope: approx. 1 pF/100 mm in air approx. 20 pF/100 mm in water

Insulated tensioning weight: approx. 2 pF in air approx. 60 pF in water

Temperature dependence of the rope capacitance: < 0.1% per °C Pressure dependence of the rope capacitance: < 0.1% per bar (in conducting liquids; in non-conducting liquids negligible)

• Tensile strength of rope probe (anchoring): max. 200 N at 20°C.

$$x \, ^{\circ}C = (x \cdot 1.8 + 32) \, ^{\circ}F$$

1 bar = 14.5 psi

Permitted operating pressures pe and temperatures T_B

Probe Lengths (100 mm = 3.94 in)

- Total length of probe rope: max. 22.000 mm
- Length of uninsulated screening: L3 min. 100 mm, max. 4000 mm
- Length of fully insulated screening: L3 min. 125 mm, max. 2000 mm
- Length of active build-up compensation: always 150 mm from where the probe rod leaves the process connection or screening.
- Length tolerances

up to 1 m: +0 mm, -5 mm up to 3 m: +0 mm, -10 mm up to 6 m: +0 mm, -20 mm up to 26 m: +0 mm, -30 mm

Process Connection Standards

- Parallel thread G 1 ½ A: DIN ISO 228/I, with sealing ring 48 x 55 to DIN 7603
- Tapered thread 1 ½ 11 ½ NPT: ANSI B 1.20.1
- DIN flanges: see flange table
 ANSI flanges: ANSI B 16.5
 Sanitary thread: DIN 11851
 Triclamp coupling: ISO 2852

Materials

Most material specifications are given in the Product Structure on page 12

- Housing: cast aluminium AlSi 12, resistant to sea-water, EP-lacquered
- · Aluminium housing, coated: in fluoropolymer
- Sealing between housing and process connection: EPDM
- Sealing for housing cover: O-ring in EPDM
- Temperature spacer: 316Ti
- Gas-tight gland: 304
- Sealing ring for process connection G 1 ½ A: elastomer/fibre, asbestos-free, resistant to oil, solvents, steam, weak acids and alkalis; up to 300°C and 100 bar (570°F and 1450 psi)
- Cable glands: standard PG in nickel-plated brass with NBR seal for cable diameter 7...10 mm; Protection IP55; ambient temperature up to 100°C (210°F)
- Watertight PG in polyamide with neoprene/CR seal for cable diameter 5...12 mm; Protection IP66; ambient temperature up to 80°C (180°F)

from the sealing surface of the process connection

Accessories

- Protective cover for the probe housing Order No. 917410-0000
- Rope shortening kit for standard probes

Material: PTFE

Max. operating temperature: 100 °C

Order No. 935598-0000

• Rope shortening kit for probes designed for use in explosion hazardous areas

Material: PTFE

Max. operating temperature: 100 °C

Order No. 935598-0001

Supplementary Documentation

Technical Information (TI)

- Electronic Inserts EC 11 Z, EC 72 Z TI 270F/00/en
